

Biodiversity on our campus

How to improve biodiversity in the Netherlands is a big question. We can start at our very own campus of Radboud University as a major player in Nijmegen, in 2018 Green Capital of Europe. With the help of a simple biodiversity index for urban green areas our campus has been investigated late 2018. With the help of the same biodiversity index, we will start actions to improve biodiversity on campus. However, no one has verified this biodiversity index! As BSc or MSc student you can help to improve biodiversity on campus by helping in the verification of this index. We will start in spring 2019 with a series of measurements on several plant and animal species groups to see whether the high-ranked areas are indeed most rich in species and of course we also want to know why!
