

Botany- Call for Internships

"Keep Knowledge growing"

Botany group is a knowledge and development partner with expertise in plant physiology, plant health and cultivation techniques. We offer research facilities and deliver reliable data to customers and enable the establishment of ideas and concepts in practice. Since 2003 we test and develop new products and techniques commercially for companies in the agricultural sector. A large part of our research is focused on crop protection products against pests and pathogens. However, we also execute many trials in cultivation techniques, substrates, fertilizers and biostimulants. Through direct interactions with our customers in the agricultural and horticultural sector, we are in the frontline of new developments and support new innovations with reliable data.

At our site in Horst – Limburg, we have compartmentalized greenhouse facilities where we are able to setup and carry out many different trials. As an intern at Botany, you will gain practical knowledge on cultivation, plant health and physiology by becoming acquainted with these trials. Furthermore, you will be able to carry out your own research project within our team and have access to all our different resources and facilities. We are looking for enthusiastic and pro-active students who are eager to translate scientific information into practical solutions that can be used. Topics of interest are developing new testing methods for biostimulants in combination with abiotic stress, developing methods for nutrient deficiencies, or digital pest insect detection. However, we are open to discuss any of your interests and ideas to come up with a suitable internship project.
